

DS Phase A/B1

HydRON-DS Phase A/B1

6th Annual ScyLight Conference / Workshop

DEFENCE AND SPACE

Airbus HydRON Team
Athens, 15 May 2023

AIRBUS

HydRON Vision

HydRON

High throughput Optical Network

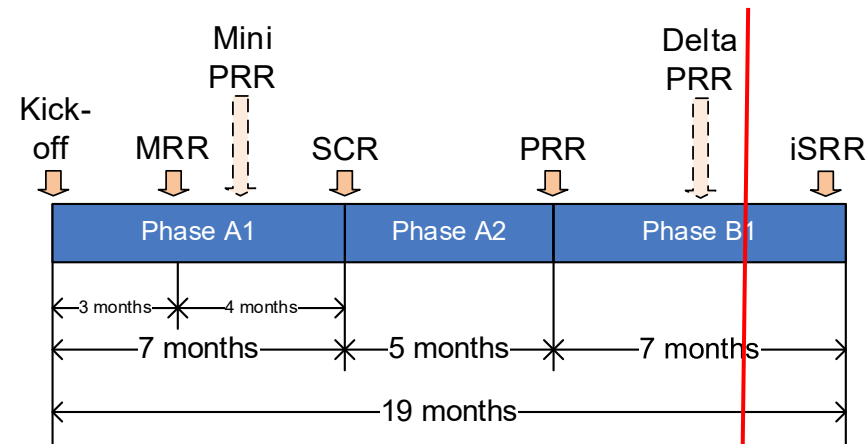

ESA Vision

“Fibre in the Sky” technology integrated in terrestrial networks at Terabit capacity demonstrated by European and Canadian Industries

HydRON Airbus team activities

HydRON Demonstration System (HydRON-DS) Phase A/B1 study, with the objective to pave the way for an Implementation Phase (B2/C/D/E1) of the HydRON-DS in order to demonstrate HydRON networking capabilities and operational concepts in an end-to-end context

HydRON Simulator Testbed (HydRON-SimTB) development with the goal of consolidating the HydRON concept, system functionalities & end-to-end system architecture mainly by network protocol and algorithm evaluation, analysis of various network designs and to support architecture trade-offs for the HydRON-DS

... together with the team as follows:

HydRON consortium

Optical Satellite
Payload

Optical Ground
Stations

User
consultancy

HydRON System Prime,
Operator and future
Service Provider

Terrestrial network

Terrestrial
network operator

**Strong expertise and dedication
in optical communication and
network solutions**

Network
management

Availability
simulations

User
consultancy and
LEO host
opportunity

HydRON-DS – Current status

Delta PRR recently introduced by ESA as a result of CM 22 with a baseline redirection

- Updated baseline and trade-off of options
- Co-location meeting passed begin of April
- Delta PRR currently under finalisation

Next steps:

- Operator workshop
- Baseline consolidation and iSRR preparation

Two major scenarios:

- LEO + MEO (TB#2 in ESA terms)
- LEO only (TB#1 in ESA terms)

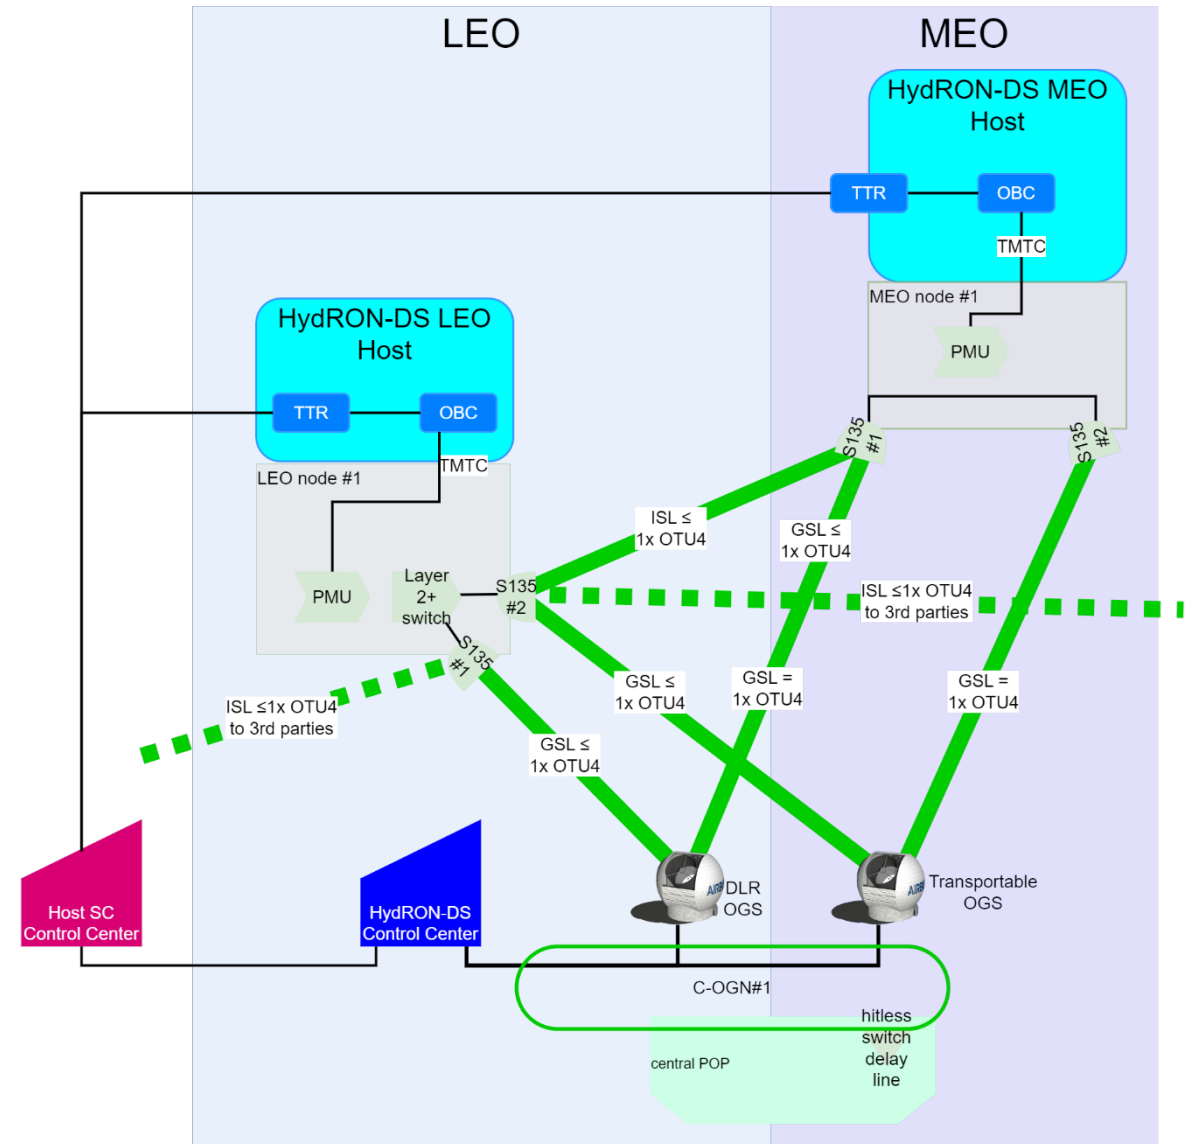

HydRON-DS – Technical baseline

Current proposed baseline for MEO + LEO scenario:

- 2 SCOT 135 on MEO + 2 SCOT 135 on LEO
- 100 Gbps / 10Gbps / transparent ISL and GSL
- Atmos. turbulence mitigation by coding
- Packet (MPLS) switch on LEO
- Reuse of existing OGS from DLR-IKN
- Demo of hitless GSL link switch-over
- Several options (+ circuit switch on MEO, + WDM on LEO/MEO, - Multi Purpose Transceiver Module)

Outcome of trade-off and final baseline selection depends largely on:

- User needs
- Host opportunities
- Budget

HydRON Simulation Testbed – Objectives

Performance Assessment

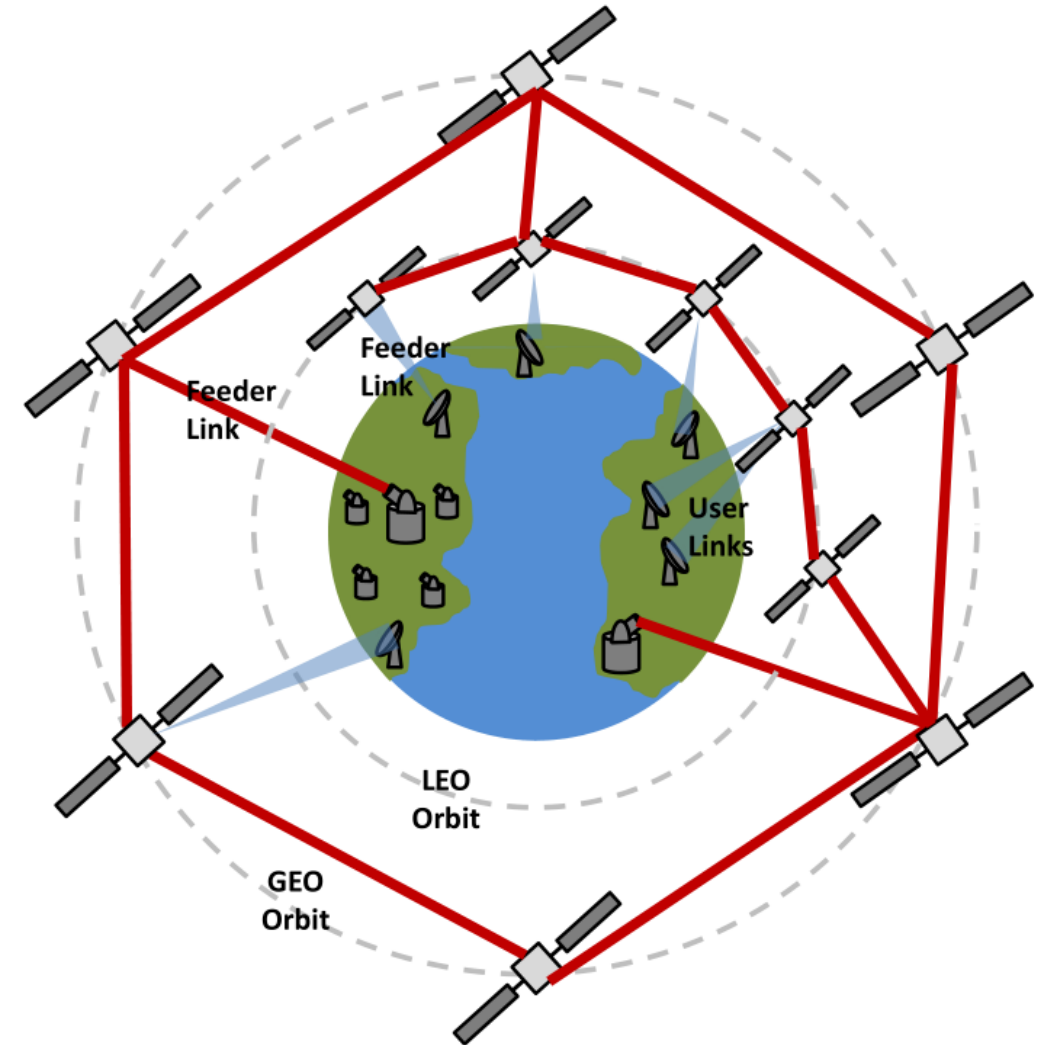

- HydRON system simulation and performance assessment
- Support trade-off of different **functional control and management protocol models** and **control plane strategies**
- Support trade-off of different key technologies (e.g. link switch-over strategies, weather/link forecasting methods, on-board switching & routing strategies)

Technology Demonstration

- Validation of different actual protocol implementations and control plane strategies
- To demonstrate the proof of concept of the hitless-switch technology

Prepare Demonstrator Mission

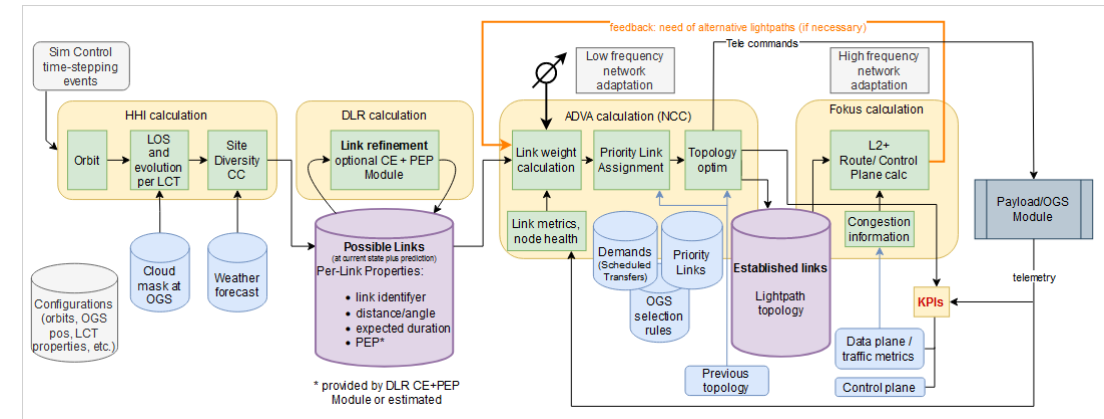

- Simulating the Demonstrator Mission
- Provide test bench for the hitless-switch technology to be integrated into HydRON-DS

HydRON Simulation Testbed – Baseline

The SimTB Discrete Event Simulator

- Simulation of > 500 network nodes, incl. orbital positions of the satellites and OGS positions
- Simulation of atmospheric and weather conditions
- Optical inter-satellite-link/route characteristics
- Performance evaluation of routing protocols for various network scenarios

The SimTB Hardware Testbed

- Emulation of satellite optical network constellations
- Emulation of real optical propagation conditions
- Emulation of real control & management protocol implementations

The Proof-of-Concept Hitless Switching bench

- Testbed to characterize the behavior of the hitless switching unit under realistic conditions
- Standardized interfaces for interoperability at a data-rate of 100Gbps

HydRON Simulation Testbed – Planned schedule
